The landing page of **tempo60 units**. By turning the roller, learners select one of the 100 sets and start the exercise in training or test mode.

Converting to the smaller unit in *training mode*: Learners develop good skills in the chosen set without time pressure.

Compare in *test mode*: As soon as the error is corrected, the dot on the clock turns yellow.

Adding to the next larger unit makes you aware of the divisibility of the size.

Working with units, safely and quickly

Does a liter have 10, 100 or 1000 centiliters - and how many kilograms does it take to make a ton?

With **tempo60 units** learners gain confidence in converting, comparing and adding *lengths*, *hollow masses*, *weights*, *currencies*, *units of time* and *areas*. The aim is to solve the exercise sets without errors in a maximum of 60 seconds.

Two modes of working

The **training mode** allows you to improve your proficiency in the selected training exercise without time pressure. The 24 problems are mixed at random.

In the **test mode**, you try to solve all 24 problems in one exercise in 60 seconds. The order of the questions remains the same.
